PINE SWISS STONE DWARF — upright, 14 year transplants B & B	16 to 24	$6.00 each			Express Collect

—FOR TERMS SEE OTHER SIDE—

1 Waste no time getting trees in the ground after arrival from the nursery. A good root system is the first essential to successful planting, and roots dry out rapidly.

2 Trees should be "heeled in" if not planted immediately. Dig an open trench and slant one side. Place the trees in layers on that side and keep wet. Tamp soil around roots.

3 On the day of planting, keep tree roots damp with wet moss or by dipping in a puddle like this one Never let the roots be exposed to the sun or wind, even for a moment.

4 A good tool for planting by hand is an ordinary mattock. One stroke should make a hole big enough for the roots of a two-year-old seedling to spread out. Roots need room.

5 Now set the tree in the hole as deep as it was in the nursery, as shown by the collar mark on its stem. See that the roots are well spread out, and then filled in with loose dirt.

6 Lastly, pack dirt firmly around the tree with the heel or toe of the shoe, so that it will stand upright. From here on it will shift for itself if given reasonable care and protection.
